

DENSE FLOW 1/2" FLUIDIZING NOZZLE

THE DENSE FLOW FLUIDIZING NOZZLE is used for bleed air into the pump vessel. It is located on the bleed airline from the control panel, which has connection to the pressure-sensing switch. The nozzle may also be used to replace the standard manifold when a blending or centrifugal action is required. It is also used as a material-agitating manifold to assist gravity flow from silos or hoppers and in fluidized tubes.
